## Introduction

This new release 12.2 is a major upgrade to the previous release 12.1. It contains several new features, major product improvements and resolved issues.

## What's new

### Connector management and licensing

It is now possible to see all connectors in a single overview.

Collectors can be shown and hidden, which affects which tasks are available. Also, the licensing model is now much more flexible, as it is possible to license individual collectors, whereas in the previous release it was only possible for the whole bundle.

### New connectors

This version brings several new connectors: Microsoft Dynamics CRM, Microsoft Azure AD, RedHat Virtualization, Slack and RayManageSoft Unified Endpoint Manager.

## Unified jobs and tasks

Another place where we simplified the usage pattern was the elimination of the "job" entity. In previous versions, jobs were merely a bridge between connectors and tasks, but this turned out to be causing a big learning curve. Instead, this version has just a single entity called a task, which is a single point of configuration for connectivity, functional and technical parameters.

### Add Task ×

General Configuration Connection Agent Settings Schedule

#### Authentication

**TENANT \***  
The directory tenant that you want to request permission from. This can be in GUID or friendly name format.

⚡

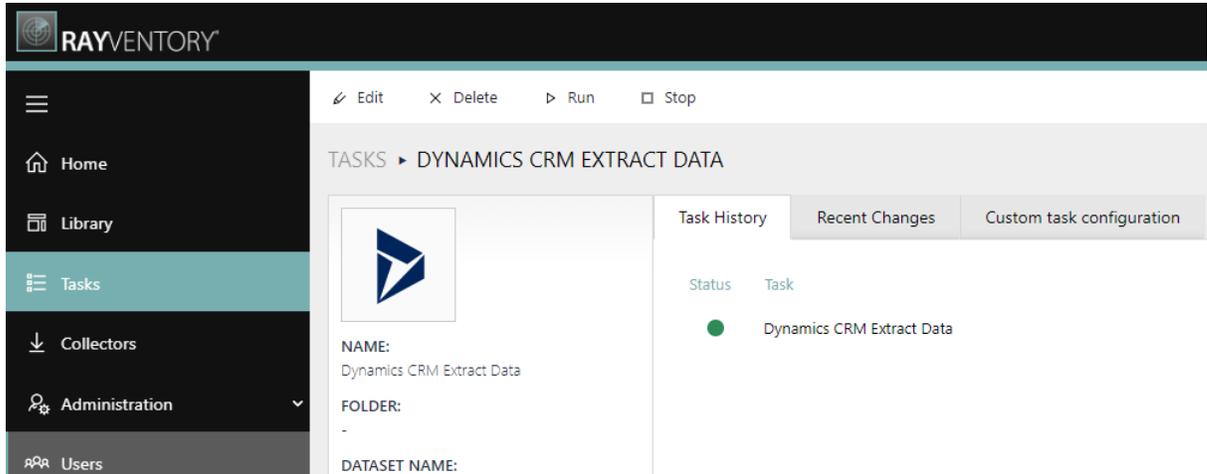

**CLIENT ID \***  
The Application ID that the Azure app registration portal assigned when you registered your app.

⚡

Also, task configuration uses a new term for "table names" which are now called "data sets". This reflects their true dual-purpose, which can be a single table or a namespace for collection of tables

## Improved UI

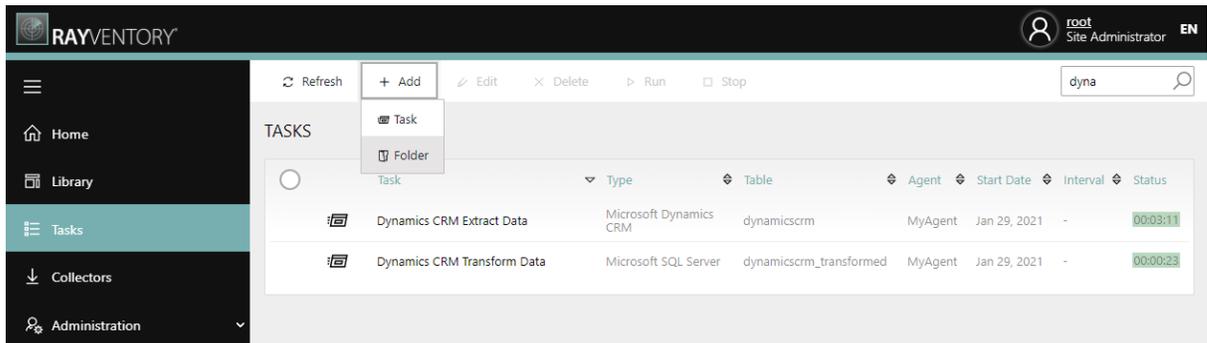

We improved the UI to better use the screen estate and making it easier to navigate around. This affects general layout, design, animations but also some subtle changes like added icons, hidden advanced content and more focus on the important things straight away in every view.

Especially the report designer should benefit from it, as we moved things around and freed some vertical space to be used by the actual report canvas.

## Folders for tasks

It is now possible to group tasks (former task and jobs) in folders of unlimited nesting.

## Adding reports from the Wizard

There is now even easier way of importing reports, both on initial run but also subsequently as they are needed. A new wizard-driven editor shows which templates are available, what requirements they have, and it makes sure that all things are in place after finishing the import. It is also integrated with the new Variables module, meaning that all sensitive information like credentials or connection strings are abstracted away and automatically added to the Variable store.

Next

## Easier setup of Data Hub agents

We removed the Downloads page, and introduced instead a simple way of downloading the agent. It requires fewer clicks, and provides the most important information right there where it is needed.

Improved installer makes sure that the settings from all previous versions are transferred.

## Automated e-mail notifications

It is now possible to send automatic, schedule-driven e-mail notifications, containing the most up-to-date versions of selected reports.

## Variables and placeholders for tasks

It is possible to use variables in tasks. The syntax for them is `###VariableName###` where `VariableName` is the name as defined in the new variable store. Variables can be protected (password-like) or open-text and can be used for all task-related parameters (typical use case: connection strings, passwords, usernames, client secrets etc.).

## Drag-and-drop reordering in library

The items in library can be now reordered using a drag and drop technique.

## Other changes

This version contains several other improvements, performance optimizations and fixes for reported issues.

- Better performance of complex reports and data collection
- Many UI-related improvements
- Adjusted default reports
- Optimized bundle size
- Translation fixes
- Changed terminology: what used to be called a "collector" or "Data Collector" in version 12.1, has been renamed to an "agent" / "Data Hub Agent" in version 12.2. This change also affects the name of the Windows Installer files.

## Migration from previous versions

This version is not backward compatible with previous releases 12.0 and 12.1.

- There is no automated migration path from version 12.0
- For version 12.1, there is automated migration, which ensures that both the server and the agent can be migrated, together with user data

For detailed information about the migration process, refer to the **Installation Guide**.

## Breaking changes

- The entities **Jobs** and **Downloads** have been removed from this build. REST API relying on their presence may break
- There is a new naming convention for tables saved in the database. Old reports rerun with updated tasks may refer to the old tables, and require manual adjustments
  - There is a coercion mechanism for users of REST API which ensures this happen automatically once preconditions are met
- The server should be always installed with the matching version of the agent. Mixing versions (for example 12.2 Data Hub and 12.1 Data Hub Agent) is not recommended and may lead to unexpected issues

# System Requirements

## Hardware Requirements

### Data Hub

Requirements when SQL Server and RayVentory Data Hub are installed on the same machine:

- Min. 4 CPU cores
- Min. 8 GB of RAM
- Min. 20 GB of disk space

Requirements when only RayVentory Data Hub is installed on the machine:

- Min. 4 CPU cores
- Min. 4 GB of RAM
- Min. 10 GB of disk space

### Data Hub Agent

- CPU: Intel Core i5
- RAM: 4GB
- Disk space: 500 MB

## Software Requirements

The following are the minimum software requirements for the installation and running of RayVentory Data Hub Server:

- Microsoft Windows Server 2012 R2 or higher

- IIS 8 or higher
- Microsoft .NET Core 3.1 – Windows Server Hosting Bundle (<https://dotnet.microsoft.com/download/dotnet-core/3.1>)
- Microsoft SQL Server 2016 or SQL Server Express 2016

**Note:**

In order to run hosting bundles, the “Universal C Runtime” is required. Modern Windows Servers should already have it, but it may be required to download for older ones. The oldest supported OS is currently Windows Server 2012 R2. More information can be found here: <https://support.microsoft.com/en-us/help/2999226/update-for-universal-cruntime-in-windows>

The following are the minimum software requirements for the installation and running of RayVentory Data Hub Data Hub Agent:

- Windows Vista SP2 / Windows Server 2008 R2 or newer
- .NET Core 3.1 Runtime (<https://dotnet.microsoft.com/download/dotnet-core/3.1>)
- Java / OpenJDK version 8 or newer is required to execute data collection from SaaS platforms

## Supported web browsers

- Microsoft Internet Explorer version 9.0 and newer
- Microsoft Edge version 80 and newer
- Mozilla Firefox version 74 and newer
- Google Chrome version 80 and newer

## Additional Information

Visit [www.raynet.de](http://www.raynet.de) for further information on RayVentory Data Hub, and take a look at the additional resources available at the Knowledge Base: <http://raynetgmbh.zendesk.com/>.

Raynet is looking forward to receiving your feedback from your RayVentory Data Hub experience. Please contact your Raynet service partner or use our [Support Panel](#) to add your ideas or requirements to the RayVentory Data Hub development roadmap!
